BROKE TO BULLISH

everything you need to know to start trading

by remoteblackgirl · Dotcom Trading

FREE GUIDE · 2026 EDITION

hey sis, welcome to the stock market.
this isn't a guru pitch and it's not a promise you'll get rich.
it's the actual basics, explained in plain language,
from someone who's still in it with you.

01 THE MINDSET BEFORE THE MONEY

Going viral isn't what gets anyone here. It takes a year (or more) of studying, testing, wins, and losses. Here's the framework worth internalizing before you place a single trade:

- Supply and demand is more stable and logical than chasing hype.
- Learning how to chart is step 1 of good trading — before strategy, before options.
- There are no shortcuts. No signal group replaces understanding what you're looking at.
- You will lose money — and then you will slowly make it back. That's the process, not a failure.
- Being grateful for the small wins allows space to be grateful for the big ones.
- Follow the banks — they're the ones with the money. Retail moves on emotion; institutions move on liquidity.

> **! This is my system — what worked for me, on my own journey. It's not guaranteed, it's not the only way to trade, and it's not personalized advice for you specifically. One trader sharing what I've learned, peer to peer.**

02 GETTING AROUND ROBINHOOD LEGEND

Robinhood Legend is Robinhood's free, browser-based desktop trading platform. Nothing to download — log into your regular account on a computer and this is what loads. Here's what each panel actually does:

- Watchlist — your running list of tickers you're keeping an eye on.
- Chart — the live price chart. This is where the real work happens once you're comfortable.
- Options Chain — every available call and put for a stock, by strike and expiration.
- Positions — what you currently own and how it's performing.
- Recent Orders — a log of trades you've placed and their status.
- Account Summary — your balance and overall performance at a glance.

You can buy or short a stock directly from the chart panel — no need to jump between screens once you've found your setup. The best way to get comfortable is to just click around before you ever place a real trade.

03 SUPPLY AND DEMAND, IN PLAIN ENGLISH

A zone isn't just “price touched here a few times.” It's the leftover footprint of an imbalance — a moment where buyers or sellers were so overwhelming that price couldn't stay there.

Why price leaves a zone sharply

When a big order comes in, it usually can't fill entirely at one price. Price gets pushed quickly to the next level where more shares are available. That fast move away from a price is the visual signature of an imbalance.

Why the zone gets revisited

If that order didn't get completely filled before price ran away, part of it is still sitting there, unfilled. When price comes back to that same zone later, those leftover orders are still active — which is why the same reaction (a bounce, a rejection) tends to happen again.

Demand zone vs. supply zone

DEMAND ZONE	SUPPLY ZONE
Buyers overwhelmed sellers. Should act as a floor.	Sellers overwhelmed buyers. Should act as a ceiling.

04 HOW TO DRAW A ZONE, STEP BY STEP

1. **Find the candle right before the move.**
   This is the last candle before price takes off — that candle is your zone. Don't draw anything yet, just spot it.

2. **Grab the rectangle tool.**
   In your broker's drawing toolbar, select the rectangle tool — not two separate lines. One tool, one shape.

3. **Drag from the wick to the top of the body.**
   Click at the wick, hold, and drag up to the top of the candle's body — one motion. Stop at the body, not the wick above it. That's the #1 mistake.

4. **Let go — that's your zone.**
   The rectangle tool draws the box for you. Zone = wick to top of body (for demand). Mirror it for supply: wick to bottom of body.

-> Candle color doesn't decide the zone type — direction of the move does. A red candle can still be the base of a demand zone; a green candle can still be the base of a supply zone.

Rinse and repeat, every timeframe

Do this same process on the monthly, then weekly, then daily, then hourly. Always start on the monthly — higher timeframe continuity is important. Where the zones line up across timeframes is your highest-quality entry.

QUICK RECAP

- Supply and demand zones are the leftover footprint of an imbalance — not just “price touched here before.”
- The zone is the candle right before the move, not the move itself.
- Zone = wick to top of body for demand, wick to bottom of body for supply. Candle color never decides it.
- Always start on the monthly and work down. Where timeframes agree is your best entry.
- There are no shortcuts. This took me a year of real reps — give yourself the same room.

A little about who's writing this

- Navy veteran
- Marketing account manager
- AI enthusiast
- Born and raised on the South Side of Chicago
- Mother of 1

I'm not a hedge fund kid. If I can learn to read a chart, you can too.
